## Laserable leatherette sheet stock

Free shipping of all US and APO orders for .45! Rose Leatherlet Seat Stock (12x24) Tags: plaque, plate, plaque plate, laser-enabled, leather, leatherlet, laser-enabled leatherlet, beyond manual thinking, I share my test results using JDS Industries sculptable leatherlets (unfortunately you need real business to become their customer). @jbv started with this article: In all tests, we chose medium PG leather to select the material and, importantly, used the new SET FOCUS feature. Sculptures at 1000 speed / 12 power / 340 lpi worked perfectly on leather seat stock and this keychain: but those settings were interestingly too much in this one. The only thing I can think of is that the leatherlet looks thin with this bottle opener, or maybe the rustic color is different from the teal: [EDIT]10 and the rustic color works beautifully. Then I did a test for scoring and cutting. The score is really capricious and it's hard to prevent the laser's start and stop points from burning all the time. Plus it doesn't look good anyway. So I don't plan to win this material. Cutting worked greatly at 150 speeds and 16 powers. 27 very nice likes. And I am aware of that lake (I'm in Fondurac). 2 likes I'm sure the guy will appreciate your setting. It's looking good! Can I also share the settings? I used 225 lpi and it comes out great as well. One thing I found is that using SVG doesn't work, you have to use .jpeg and I think .pdf will work too. For black and silver wallets, you need to make sure that you bump into the power of 9 and stick something between the flaps to make sure the edge of your wallet is level. 7 Like Hi Greg! There are many posts to work without a breadout tray - but this may help: Set focus with material above .5 (without tray) also seriously set the focus to everything. That's the best answer: unless you're doing line 3 likes that are not particularly focused, I've tried Set Focus/ I've used other leatherlet items for engraving and it doesn't work like I didn't mark leather. And I tried math to set the thickness of the material, and is it doing the same thing? Did you click on the link? When you set the focus, the item you want to mark is focused. If it's 1.5 so you still need to get the item within 1/2 of the laserThe item is fine, but if it is a thick item of 1 1/4 inch, you need to put at least 1/4 of something under it. It's .75, so I put something under it to make it a total of 1.625. I tried to add another scrap of calibration grade under the first time it didn't work to get it to a total of 1.75, but there's nothing yet. I've never used Set Focus, but click on the link and move the square over my material. I actually turned off my glow forge and went back to see if it would help, and now I'm struggling with centering. Yes, that's what I did, and that's the number I followed to set the thickness of the material first. I think I understand what's going on! I'm sculpting now! I like 2 yes. See it. If you post at the same time, sometimes you will do it. All right. If there is no mark. If it is fired, it is a configuration issue and the setting will fall to power 1 depending on the order of what you clicked. Or is the leather item new? I found the thickness of the material hidden in my saved settings that I forgot. It's worked! Thanks!!! greg.zinkham: Make sure you stick something between the flaps to make sure the edge of your wallet is level. Greg, can I ask you what you put between the flaps to make sure the end of the wallet is level? : I like one thanks for these settings. I've used them to earn up this Leatherlet Journal as a personalized award for perfectly excellent computer science students! Like Laser Leather Seat Stock Laser Possible Leatherlet offers a real leather look and feel at just a small part of the price. This rich texture, synthetic material is water resistant to durability, washed enough for the severity of daily use. The high quality work of each leatherlet is sure to impress all recipients with their elegant personality. Laser-powered leatherlet items can be personalized through laser engraving for sharp contrast or screen printing for full-color effects. Make the laser black to increase the contrast. Black laser on gold or silver for an elegant look. Laser-retted seat stock is 3/64 thick. The seat is 12 inches x 24 inches. Cut with laser, scissor and hobby knife. Cleaning instructions: Use water and soap to clean laser-powered leatherlet items. It doesn't leave a speck of water. Alcohol is suitable for pen marks. Leatherlets do not absorb finger oil. Other notes: The front has suede like a texture. The back is black and has a standard leather texture.
